## **INSTRUCTIONS TO CANDIDATES:**

1. Submit your assignment online in Moodle unless advised otherwise
2. Late submission will be awarded zero(0) unless Extenuating Circumstances (EC) are upheld
3. Cases of plagiarism will be penalized
4. You must obtain at least 50% in each component to pass this module

## Introduction

With the pandemic COVID-19 still lingering around us, healthcare has become of utmost importance. People fear for their health and safety now more than ever. Here comes the purpose of this Introduction to C Programming Assignment, which is to create program to manage a Health Insurance Management System for the insurance company ZeeMediLife. This program allows users to subscribe to insurance plans of their choice manually. Furthermore, user can access this program's multiple features such as fund claiming, account information checking and searching capabilities based on the user's needs.

## Assumption

When I was doing this assignment, I complete the coding part first then I design the pseudocode and flowchart. Thus, I faced some problem while doing pseudocode and flowchart. Also, at the beginning I doing this assignment, I thought I just need user to input their id, then I just realise the program should have enough intelligence to auto increment the subscriber ID while doing register. After that, I thought the split function is just similar to the python assignment, but after I doing some research it is definitely not same with python, Hence, I do a lot research in many document.

## FLOWCHART FUNCTION : searchingFunctionalities4 ()

## Explanation of portable ANSI C programming Concepts

### #include

```
#include <stdio.h>
#include <string.h>
#include <stdlib.h>
#include "header.h"
#include "structheader.h"
```

For the beginning of the C programming, I put all the header file in the top of source code to ensure I can use the features of library provided. The C preprocessor is a macro preprocessor transform sources code before compiler the program. The keyword “#include” is telling the C compiler to include the contents of header files and allow to use those features includes in header file. For example, <stdio.h> allow the C compiler using the function like scanf() and printf(). <string.h> allow the C compiler using the function like strtok() and strcmp(). <stdlib.h> allow the C compiler using the function like atoi(), itoa(), atof() etc. Without including these header file Compiler will not going to understand the meaning of our source code and cannot compiler the code successfully.

### Function

Function part can separate into 3 part such as, function prototype, function call and function definition. For the first part, function prototype is also can include in header file. The purpose of the function prototype is ensuring the declaration of data type of parameter while using this function. This can be to avoid the conflict of declaration of parameter when passing the value into this specific function.

```
1  #ifndef HEADER_H_INCLUDED
2  #define HEADER_H_INCLUDED
3
4  void doingSubscription();
5  void claimProcessing ();
6  void accountsInformation();
7  int mainMenu ();
8  void searchingFunctionalities1();
9  void searchingFunctionalities2();
10 void searchingFunctionalities3();
11 void searchingFunctionalities4();
12 void split(char[][80], char *, char* );
13
14 #endif // HEADER_H_INCLUDED
```

After that, function call is calling the function when wanted to use the function and passing the value into this function. So that, it's can return some result after execute finish the sources code.

```

    if (option == 1){
        doingSubscription();
    }

```

At the last, function definition is the location of main sources code. After calling by other different object or place, it will execute the entire code to do some instruction like addition, subtraction , multiplication and division.

```

void split(char details[][80], char* str, char* spl)
{
    int n = 0;
    char * storage = NULL;
    storage = strtok(str, spl);
    while(storage != NULL )
    {
        strcpy(details[n++], storage);
        storage = strtok(NULL, spl);
    }
}

```

### VOID and INT function

The purpose of these two types of function are similar. Declaration of int must return value to the program that called this function, but void function does not need return any value while finish the execute

```

return 0;

```

### Variable

```

char lastLine[1024], details[20][80], valid[10];
int id, oldID, check, year=2020;

```

Majority of this assignment, I used these variables to write my program. This screenshot is showing the declaration of variable. lastLine[1024] is declaring allow to store about 1023 characters words and 1 “\0” for letting the C compiler knew the ending of the char. Also, these 1023 character is store by each memory buffer for each word. Variable details[20][80] is a declaration of 2-dimension character. Others vairable is declare as int for store value of decimal form.

## Control structure (nested if)

Control structure is perform checking condition to helping make decision to selecting their command or other function as they wanted.

```

if (check == 1){
    searchingFunctionalities1();
}
else if (check == 2){
    searchingFunctionalities2();
}
else if (check == 3){
    searchingFunctionalities3();
}
else if (check == 4){
    searchingFunctionalities4();
}
else{
    mainMenu();
}

```

Control structure if is for using at while the condition is only 1, In this case of ifcondition, when check equal to one, it is enable to run and calling the searchingFunctionalities1() functions, or else it will going to check another condition and running the specific functions.

## LOOP structure

Looping structure is performing the loop for sequence number of times.

```

do {
    printf ("-- MAIN MENU --\n1. Insurance Plan Subscription\n2. Claim Proce
    if((scanf("%d", &option))!=1){
        printf ("INVALID INPUT\n");
        scanf("%*s");
    }
    else{
        if (option == 1){
            doingSubscription();
        }
        else if (option == 2){
            claimProcessing();
        }
        else if (option == 3){
            accountsInformation();
        }
        else if (option == 4){
            menu();
        }
        else{
            printf ("\nINVALID INPUT\nPlease enter again\n");
        }
    }
}while (option >= 5 || option <= 0);

```

In this example is using DO WHILE looping structure. DO WHILE allow me to run once time the program before checking the condition of the while condition.

.txt file

## READ MODE

```
FILE *f;
f=fopen("subscription.txt", "r");
if (f==NULL)
    printf("Could not open file.");
while (!feof(f))
    fgets(lastLine, 1024, f);
fclose(f);
```

The purpose of the first line is declaring file handle as 'f' variable. Thus, it allows me to use 'f' file handle to perform more features. After that, the 'f' file handle is used to open "subscription.txt" with READING mode. This action can let the c compiler know the purpose of this file handle is reading the data from "subscription.txt". If the file is empty the .exe file will print "could not open file" for telling the user the specific file does not exist. While the file is not empty it will go into a looping structure and read the specific file line by line until the file is empty. When it is empty the program will close the file.

## WRITE MODE

```
fpl = fopen("subscription.txt", "r");
fptemp = fopen("replace.tmp", "w");
if (fpl == NULL || fptemp == NULL)
{
    printf("\nUnable to open file.\n");
}
CurrentIndex = 1;
while ((fgets(StrLine, 1024, fpl)) != NULL)
{
    if (CurrentIndex==id){
        fprintf(fptemp, "%d\t%s\t%s\t%s\t%s\t%d\t%d\t%d\t%d\t%d\t%d\t%s\t%s", id, details[1], de1
    )
    }
    else{
        fputs(StrLine, fptemp);
    }
    CurrentIndex++;
}
fclose(fpl);
fclose(fptemp);
remove("subscription.txt");
rename("replace.tmp", "subscription.txt");
mainMenu();
```

Write mode can re-write the whole .txt file. It means it will clean all the data that is included in the file first, then it starts to write the file.

## APPEND MODE

```
f = fopen("subscription.txt", "a");
if (f == NULL)
    printf ("Could not create .txt file");
else{
    fprintf(f, "%d\t%s\t%s\t%s\t%s", id, subs[id].name, subs[id].contact, subs[id].address, subs[id].history);
    fprintf(f, "\t%d\t%d\t%d\t%d\t%d", subs[id].age, subs[id].plan, subs[id].plan2, subs[id].claim, subs[id].claim2);
    fprintf(f, "\t%d\t%d\t%d\t\n", year, subs[id].roomFee1, subs[id].roomFee2);
}
fclose(f);
```

Append mode is based on previous data and adding new data into this specific .txt file. That means it is not the same as write mode; it does not rewrite the whole file, it is adding new lines under the previous data.

## Additional Features

### atoi

```
oldID = atoi(details[0]);
```

Atoi is stand for array to integer, which mean it allow changing the char datatype into int datatype. This feature can allow to scan the details[0] character and auto skipping those spacebar or tab. When it cannot change to integer form, it will return 0 value to the variable.

### strtok

```
storage = strtok(str, spl);
```

Strtok is stand for split string into token. The purpose of strtok used for splitting the string into few tokens, which are category by any of the characters that are the part of delimiter. The first parameter is the data that I wanted split and broke into few smaller values. The second parameter is the delimiter which is categorizing the data in the .txt file.

### strcpy

```
strcpy (display, "Plan 120") ;
```

Strcpy is stand for string copy. The purpose of strcpy used to copy the second parameter data into the first parameter data. But the condition is the datatype of destination must declare as character datatype. So, that Strcpy instructuion can be execute successfully,

```
FFLUSH (STDIN) & SCANF("%*s")
printf ("\nMore than 15 days ? YES/NO\n");
fflush(stdin);
gets(valid);

if((scanf("%d", &option))!=1){
    printf ("INVAIID INPUT\n");
    scanf("%*s");
}
```

Fflush (stdin) is used for reset the value of stored in memory buffer for now in console. So that, it can avoid get spacebar (black space) value and inside the valid variable. After that scanf(“%\*s”) is also used to free the memory buffer ram and refresh it to the console, So its can continue execute the code.

### SCANF ()

```
if((scanf("%d", &option))!=1){
    printf ("INVAIID INPUT\n");
    scanf("%*s");
}
```

Scanf () function allow to return a value to the variable. It will return 0 value when the number is integer but when it is not integer (int) datatype such as character (char), it will return 1 into this if-statement, when it is 1 it will ask user insert the value again.

### STRUCT ()

```
struct subscription{
    char name[40],contact[15],address[1024],history[1024];
    int age,plan,plan2,roomFeel,roomFee2,claim,oriClaim;
} subs[1000];
```

Struct () function allow store value in each variable. Thus, it can avoid declare too many same variables in each function. All function can using struct variable for while doing calculation or coding.

### TIME\_T

```
time_t timep;
struct tm *p;
time (&timep);
p=gmtime (&timep);
```

Time\_t is allowed getting the actual life time from now, its allow to print or recording now actual time while user is using this system to claim money.

### SPLIT FUNCTION

```
void split(char details[][80], char* str, char* spl)
{
    int n = 0;
    char * storage = NULL;
    storage = strtok(str, spl);
    while(storage != NULL )
    {
        strcpy(details[n++], storage);
        storage = strtok(NULL, spl);
    }
}
```

Split function is allowed spilt the data lines and store the splitting result in details[X]. first, the first parameter is the splitting result that wanted to store in a 2-dimensional character array. Second parameter is passing the while data line from .txt. third parameter is the delimiter of the sentence. After that, **Char \* storage = null** is declaring a char pointer to store the data line from .txt file for the moment. The purpose of declaring char pointer is strtok must using char pointer to split the data line. The reason why cannot using declaration

of char because strtok is not allowed, all the char got their own personal memory buffer for each character, but char pointer is saving whole data string in 1 memory buffer so that it is be split by using strtok.

After that it will go into while condition, first it strcpy the first variable and saved it into details[0]. Then, **storage = strtok (NULL, spl)** is reset the value to NULL after finish copying 1 variable into detail[], when it is not NULL again , It will loop it again and again until storage is NULL.

### ABS

```
overload = abs(balanceAmount);
```

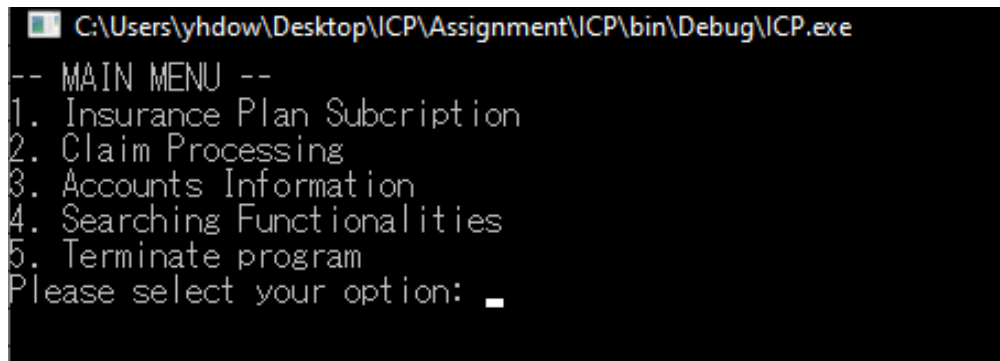

Abs used for absolute the value. That's mean its allow change all negative value into positive value.

## Test Specification Table

N O	FUNCTIO N	INPU T	EXPECTATION	RESULT	ACTIO N TAKEN	FINAL RESUL T
1	mainMenu( )	1	Call doingSubscription( )	Call doingSubscription( )	Calling the specific function	PASS
2	mainMenu( )	2	Call claimProcessing	Call claimProcessing	Calling the specific function	PASS
3	mainMenu( )	basba	ERROR	INSERT AGAIN	Insert again	PASS
4	mainMenu( )	3	Call accountsInformati on ()	Call accountsInformati on ()	Calling the specific function	PASS

## Screenshots of Sample Input / Output and Explanation

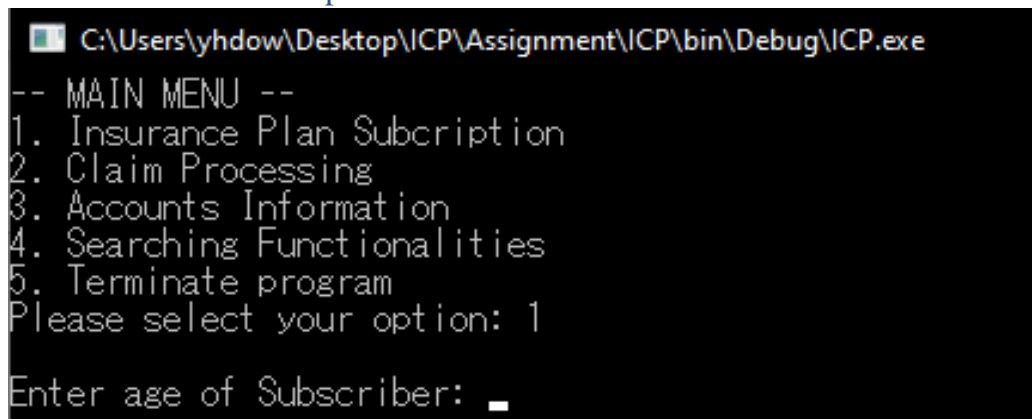

### Main Menu

A screenshot of a Windows command prompt window showing the main menu of a program. The title bar indicates the file path: C:\Users\yhdow\Desktop\ICP\Assignment\ICP\bin\Debug\ICP.exe. The menu text is as follows:

```
-- MAIN MENU --  
1. Insurance Plan Subscription  
2. Claim Processing  
3. Accounts Information  
4. Searching Functionalities  
5. Terminate program  
Please select your option: _
```

This is the main menu when the program is start-up. As you see, it allow to choosing 5 option for the user. Then based on user requirement choosing those that user want.

### Insurance Plan Subscription

A screenshot of the same Windows command prompt window, but now showing the 'Insurance Plan Subscription' screen. The user has entered '1' at the prompt. The text is as follows:

```
-- MAIN MENU --  
1. Insurance Plan Subscription  
2. Claim Processing  
3. Accounts Information  
4. Searching Functionalities  
5. Terminate program  
Please select your option: 1  
  
Enter age of Subscriber: _
```

When user enter 1 as their input, the program will asking the age of the subscriber first.

```
C:\Users\yhdow\Desktop\ICP\Assignment\ICP\bin\Debug\ICP.exe
-- MAIN MENU --
1. Insurance Plan Subscription
2. Claim Processing
3. Accounts Information
4. Searching Functionalities
5. Terminate program
Please select your option: 1

Enter age of Subscriber: 0

More than 15 days ? YES/NO
yes

-- Available Insurance Plan Subscription --
1. Plan 120
2. Plan 150
3. Plan 200
Please select your plan:
```

When user enter 0 value as their input, then program will asking the child is more than 15 days. If yes it will display 3 option to the user.

```
-- Available Insurance Plan Subscription --
1. Plan 120
2. Plan 150
3. Plan 200
Please select your plan:1
1. Annual package
2. Lifetime package
Please select your plan:1

Enter the following detail of subscriber
Name: _
```

After asking the plan and claim limit type the program will asking user to enter the details of the user.

```
C:\Users\yhdow\Desktop\ICP\Assignment\ICP\bin\Debug\ICP.exe
1. Annual package
2. Lifetime package
Please select your plan:1

Enter the following detail of subscriber
Name: Magnum
Contact number: 019912451
Address: 12, Jalan SL 5/10, 55200, KL
Health history: Healthy

-- Subscriber Detail --
Name           :Magnum
Contact number  :019912451
Address        :12, Jalan SL 5/10, 55200, KL
Health history  :Healthy
Age            :0
Subscription ID :S007
BENIFI AVAILABLE
Maximum room charges claim limit per day :
Normal ward : RM120
ICU : RM250
Record successfully

-- MAIN MENU --
1. Insurance Plan Subscription
2. Claim Processing
3. Accounts Information
4. Searching Functionalities
5. Terminate program
Please select your option:
```

After inserted all the following details, the program will print all the detail and benefit to the user again for him checking. After that, it will return to the main program.

```
-- MAIN MENU --
1. Insurance Plan Subscription
2. Claim Processing
3. Accounts Information
4. Searching Functionalities
5. Terminate program
Please select your option: 1

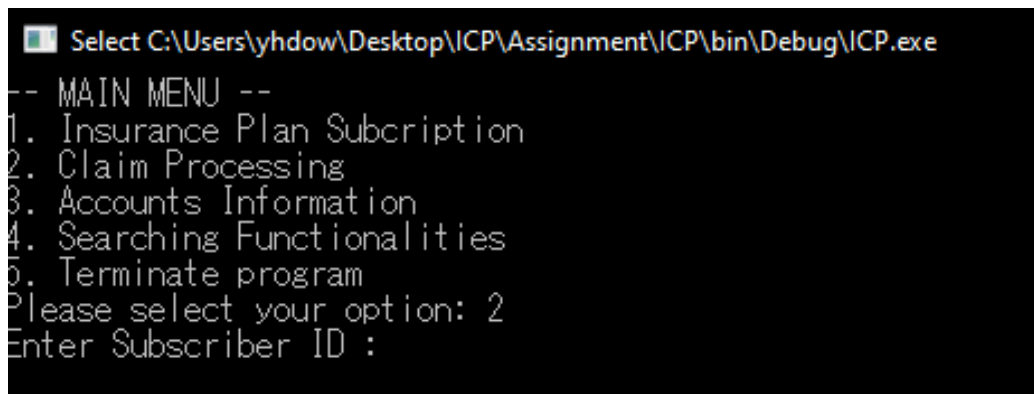

Enter age of Subscriber: 25

-- Available Insurance Plan Subscription --
1. Plan 150
2. Plan 200
Please select your plan: 1
```

When the age of the user is older than 20, the program will only show plan 150 and plan 200 for the user select, (same reason to user that older than 41 and lower than 54).

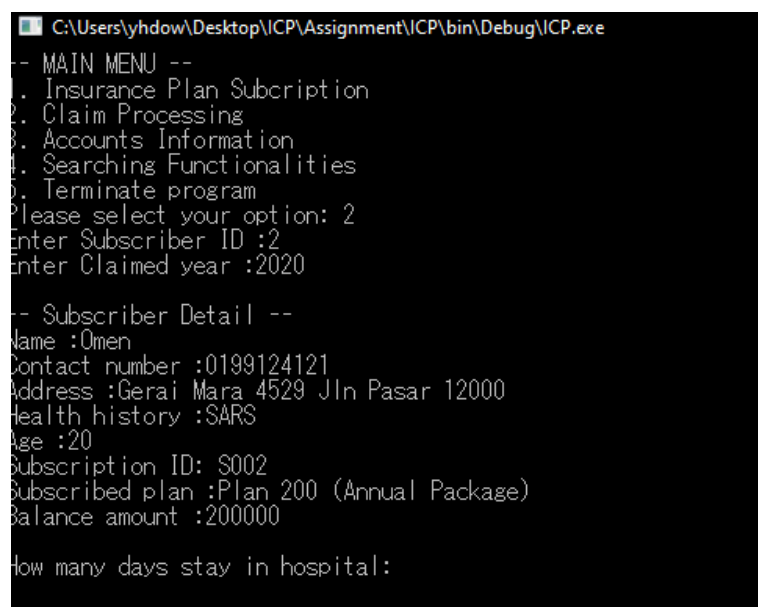

## Claim Processing

```
Select C:\Users\yhdow\Desktop\ICP\Assignment\ICP\bin\Debug\ICP.exe
-- MAIN MENU --
1. Insurance Plan Subscription
2. Claim Processing
3. Accounts Information
4. Searching Functionalities
5. Terminate program
Please select your option: 2
Enter Subscriber ID :
```

When user enter “2” as their input at main menu section, the program will asking the ID of subscriber that want to claim.

```
C:\Users\yhdow\Desktop\ICP\Assignment\ICP\bin\Debug\ICP.exe
-- MAIN MENU --
1. Insurance Plan Subscription
2. Claim Processing
3. Accounts Information
4. Searching Functionalities
5. Terminate program
Please select your option: 2
Enter Subscriber ID :2
Enter Claimed year :2020

-- Subscriber Detail --
Name :Omen
Contact number :0199124121
Address :Gerai Mara 4529 Jln Pasar 12000
Health history :SARS
Age :20
Subscription ID: S002
Subscribed plan :Plan 200 (Annual Package)
Balance amount :200000

How many days stay in hospital:
```

After entering id and year, the program will display all the detail of the subscriber. If the year is not equal to the claim year that he previous claim(if first then ignore), then program will auto reset the claim limit when subscriber is annual claim limit type.

```

C:\Users\yhdow\Desktop\ICP\Assignment\ICP\bin\Debug\ICP.exe
How many days stay in hospital: 10
Types of room service
1. Normal ward
2. ICU
Please select your option :1
-- Other claimed method --
1. Hospital Supplies and Services
2. Surgical Fees
3. Other Fees
4. Exit
Please select your option :1
Insert the amount that subscriber has been claimed : 1000
-- Other claimed method --
1. Hospital Supplies and Services
2. Surgical Fees
3. Other Fees
4. Exit
Please select your option :4
-- Subscriber Detail --
Name :Omen
Contact number :0199124121
Address :Gerai Mara 4529 Jln Pasar 12000
Health history :SARS
Age :20
Subscription ID: S002
Subscribed plan :Plan 200 (Annual Package)
Before claimed Balance amount : 200000
After claimed Balance amount: 192000
Extra payment : 0
Recorded time : 16:34:23
-- MAIN MENU --
1. Insurance Plan Subscription
2. Claim Processing
3. Accounts Information
4. Searching Functionalities
5. Terminate program
Please select your option:

```

Then the program will be asking the amount of value that user wanted to claim, then the program can calculate all the claim amount and print the balance and claimed amount to the user. After that it will auto return to main menu.

### Account Information

```

SUBSCRIBER THAT CLAIMED AMOUNT IN LIFETIME CLAIM LIMIT
-- NOT Subscriber Detail --
Name :Loo
Contact number :01231245
Address :Jalan Perdana 3/8, Taman Midah, 55300 , WPKL
Health history :Healthy
Age :40
Subscription ID :S006
Subscribed plan :Plan 200 (Annual Package)
Claimed amount :RM 990000
Balance amount :RM 10000 (2020)
Maximum room charges claim limit per day :
Normal ward : RM200
ICU : RM700
Total amount claimed by Lifetime Claim Limit subscribers : 990000
Total number of Annual Claim Limit subscribers who have exhausted all their eligible amount : 0

```

When the user insert 3 as their input it will print all the details off subscriber for annual and lifetime who suitable the condition.

## Searching Functionalities

```

```

When user enter 4 as their in Searching Functionalities menu, then program will asking the age of the person then display info to the screen

## Conclusion

After completing this assignment, I learnt that in order to do well in something, hard work and time must really be heavily invested. I have learnt a lot through this assignment, mainly time management and self-discipline. I am really glad to have completed this assignment and I hope this program will be able to help many people.
